

# Remastering Legacy Java

2019.5.15

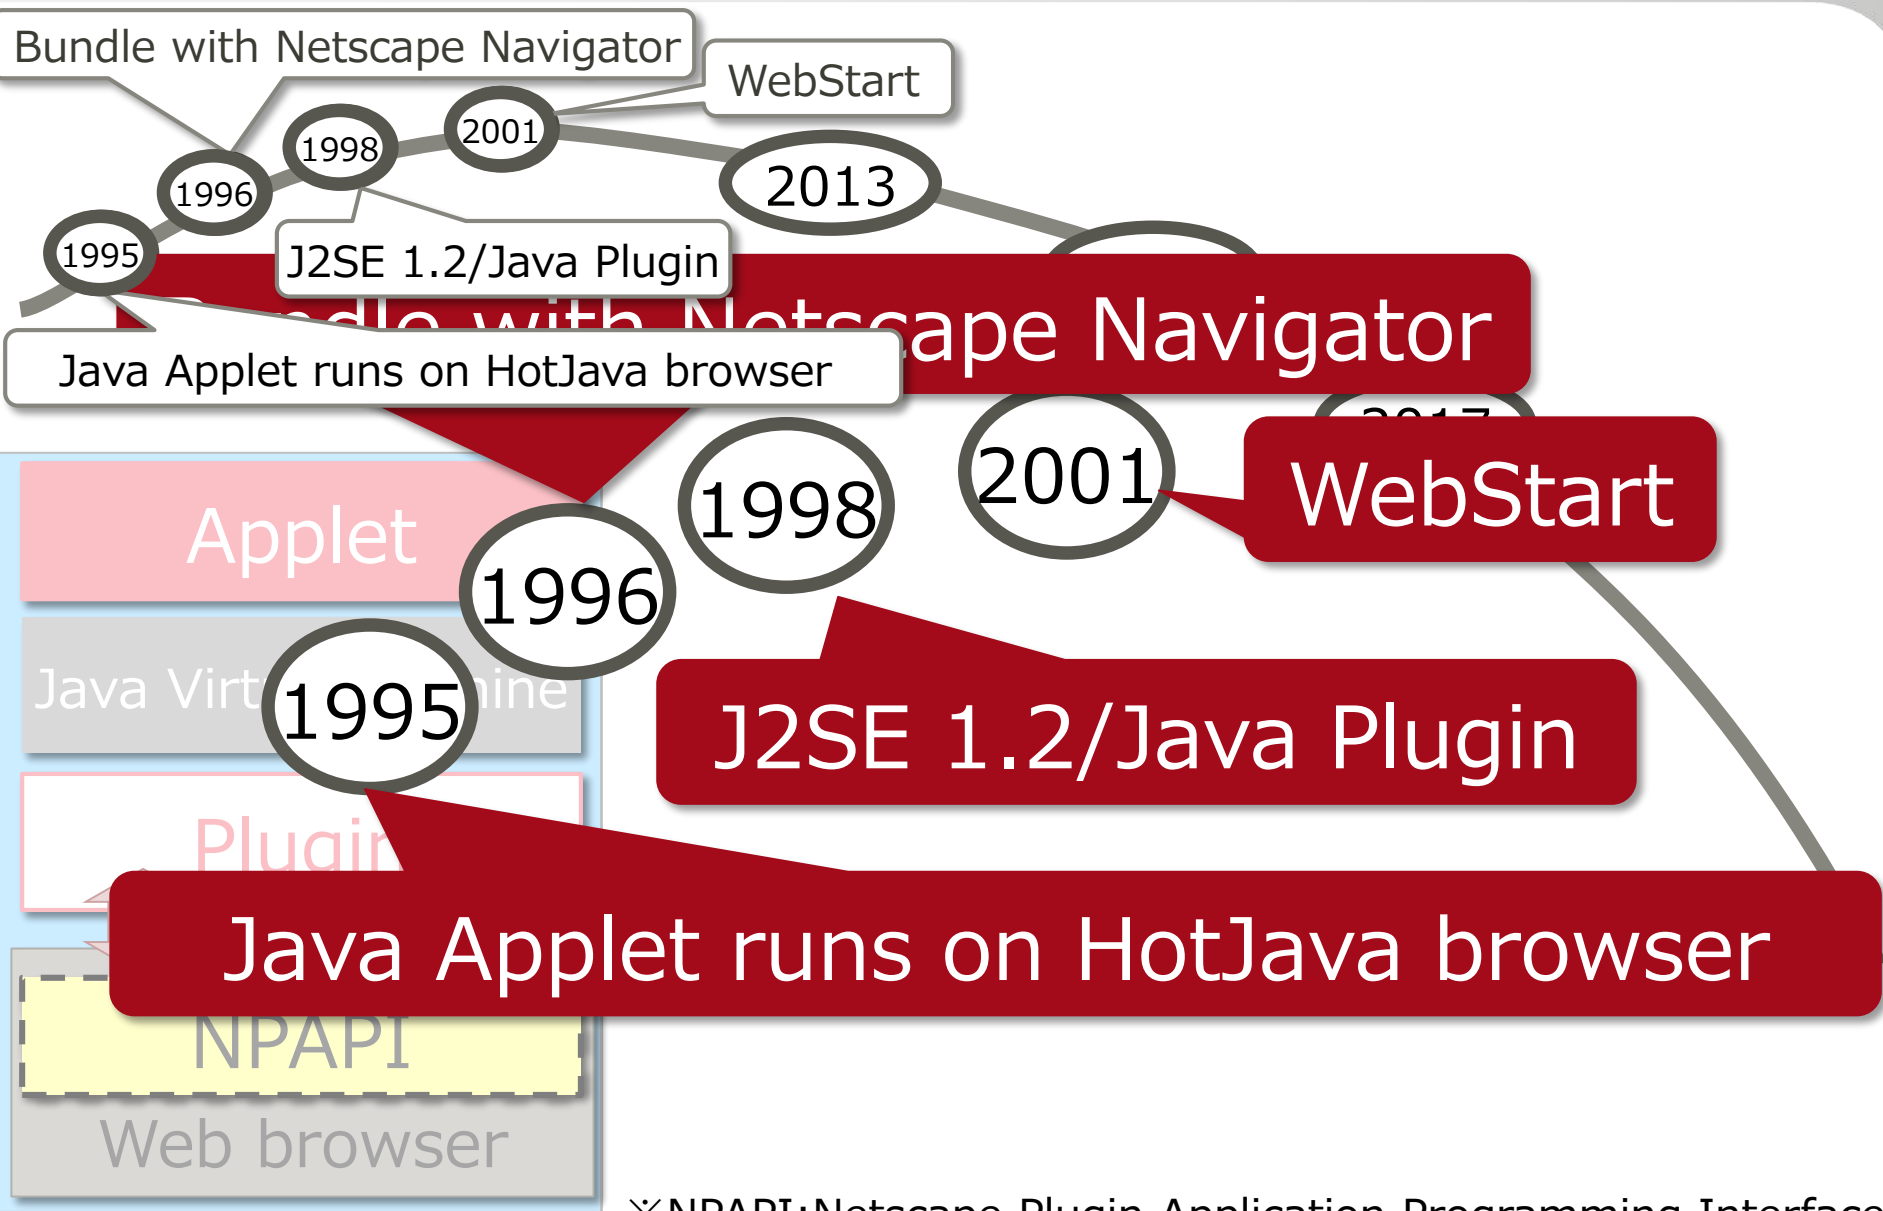

Kenji Kazumura

- One of the oldest Java related products vendor
  - Including Java for mainframe
- Interstage Application Server since 1998
  - Java EE certified GlassFish base application server
- Interstage Studio
  - Eclipse base
  - classic GUI library for client desktop

# History of Client Java

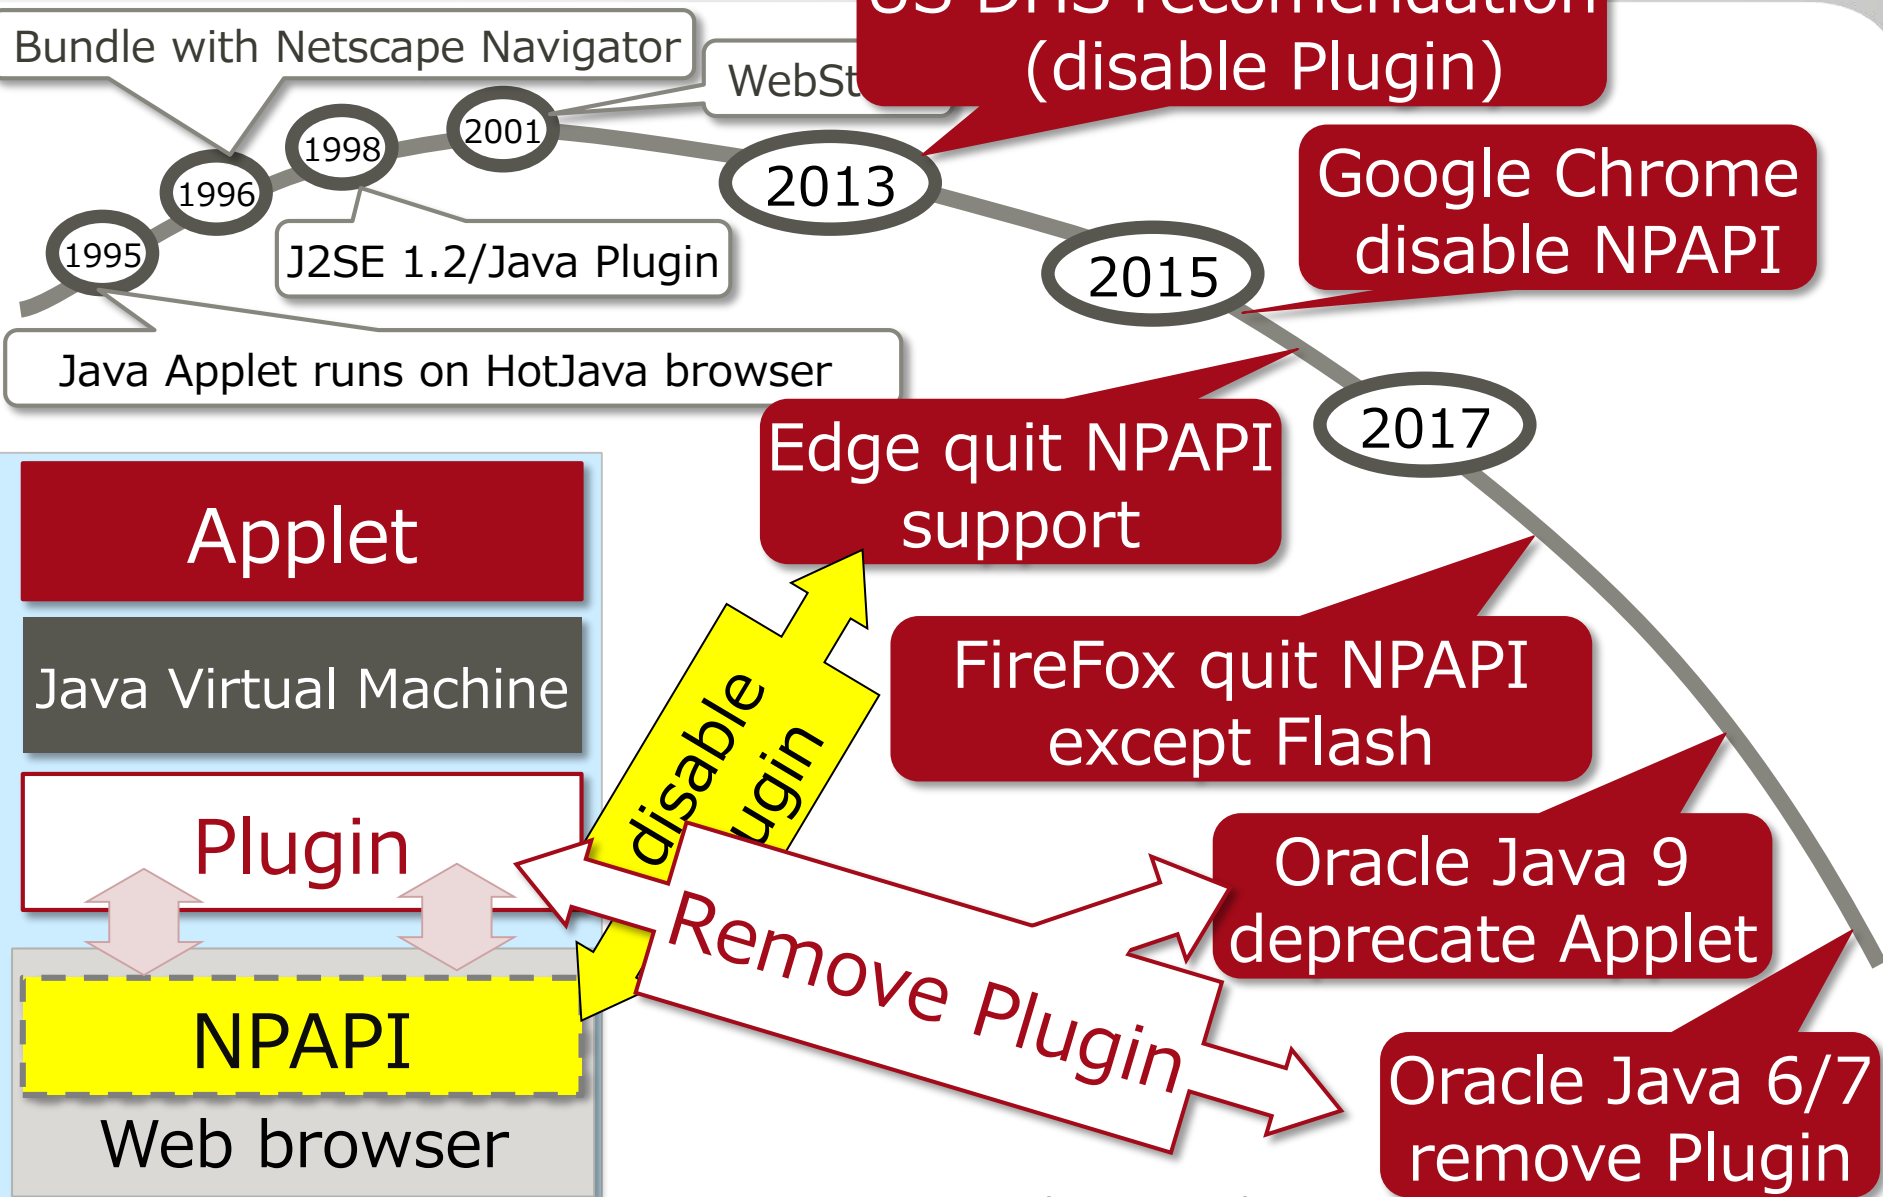

# Applet Technology

※NPAPI:Netscape Plugin Application Programming Interface

# Applet Technology

※NPAPI:Netscape Plugin Application Programming Interface

# Applet Resources

How much are there Applet ?

Fujitsu Customers	# of client pc
 A Company	90,000
 B Company	70,000
 C Company	54,000
 D Company	21,000
 E Company	5,000
 F Company	3,500
 G Company	3,000
 H Company	3,000
Total	249,500

# Migration Plans

1 Use Applet

until end of IE11

2 Use JSP/JSF

JavaServer Faces

Not so much used ?

3 use HTML5/JavaScript

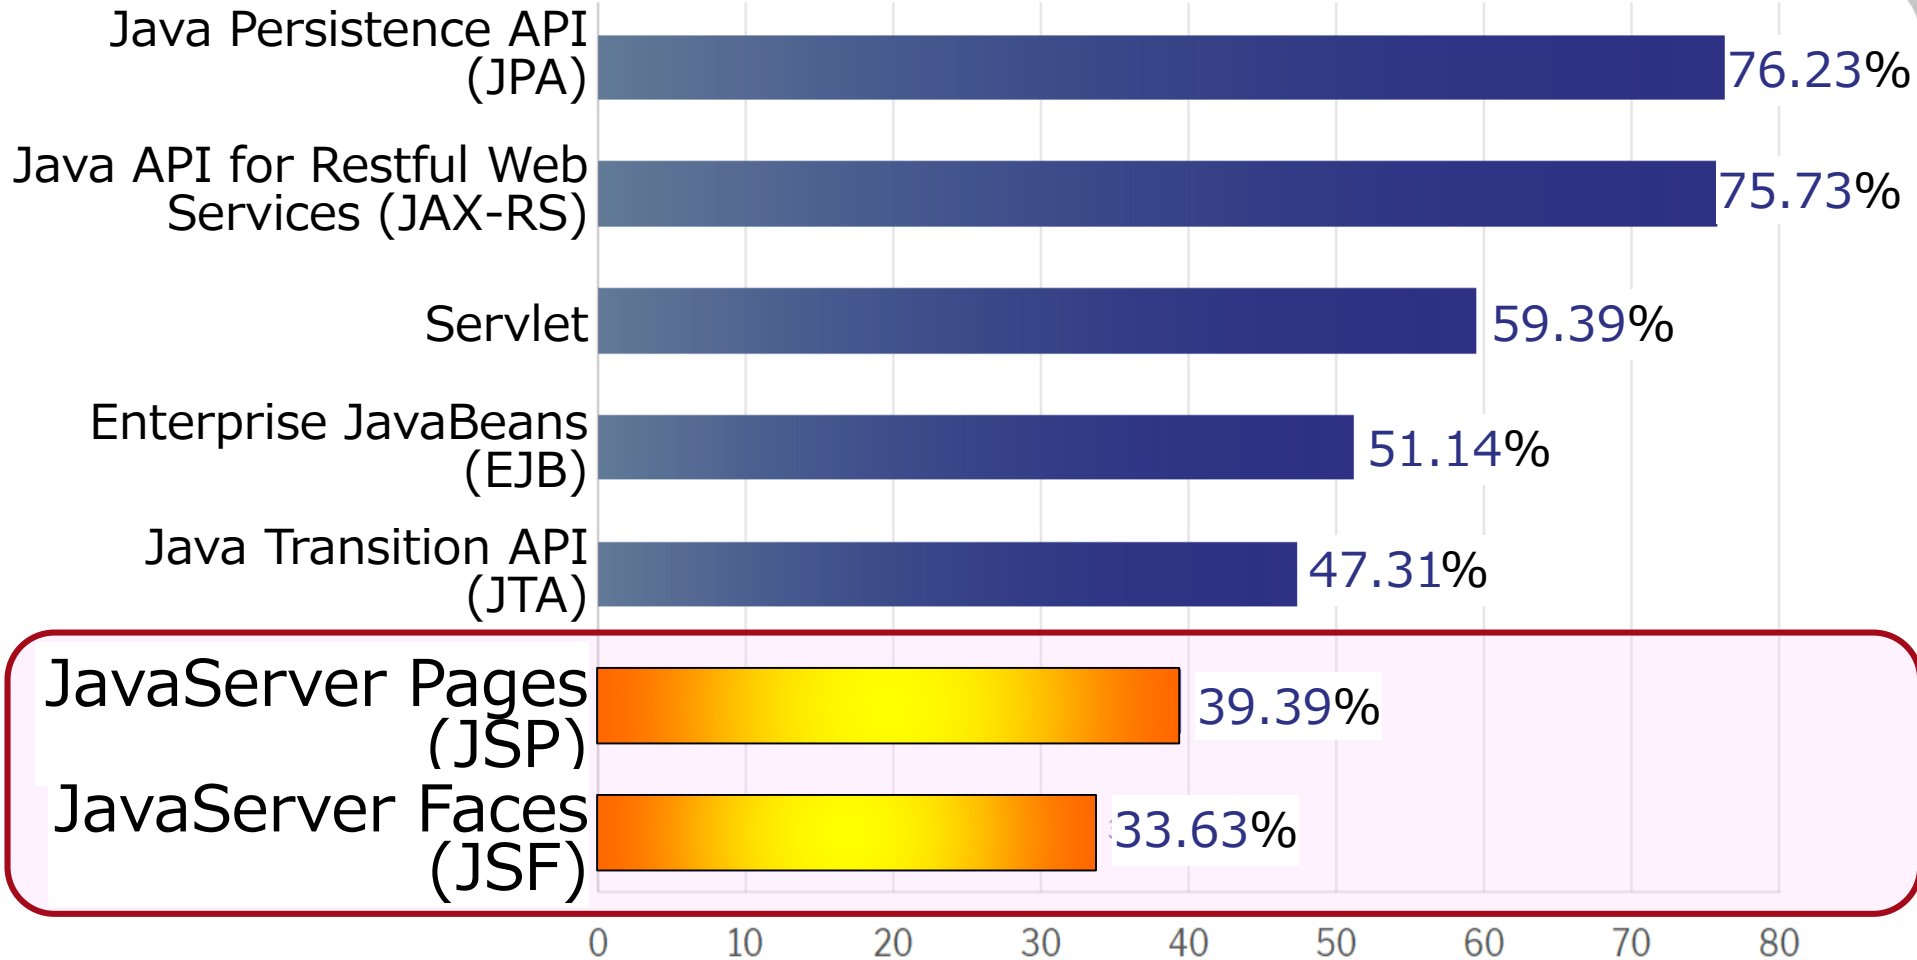

favorite!?

ANGULARJS  
by Google

# Jakarta EE survey (used API)

※<https://jakarta.ee/news/2018/04/24/jakarta-ee-community-survey/>

**JSP/JSF are not used so much**

## DukeScript

Java app runs on browser without Plugin  
<https://dukescript.com/>

## jpro

JavaFX app runs on browser  
<https://www.jpro.io>

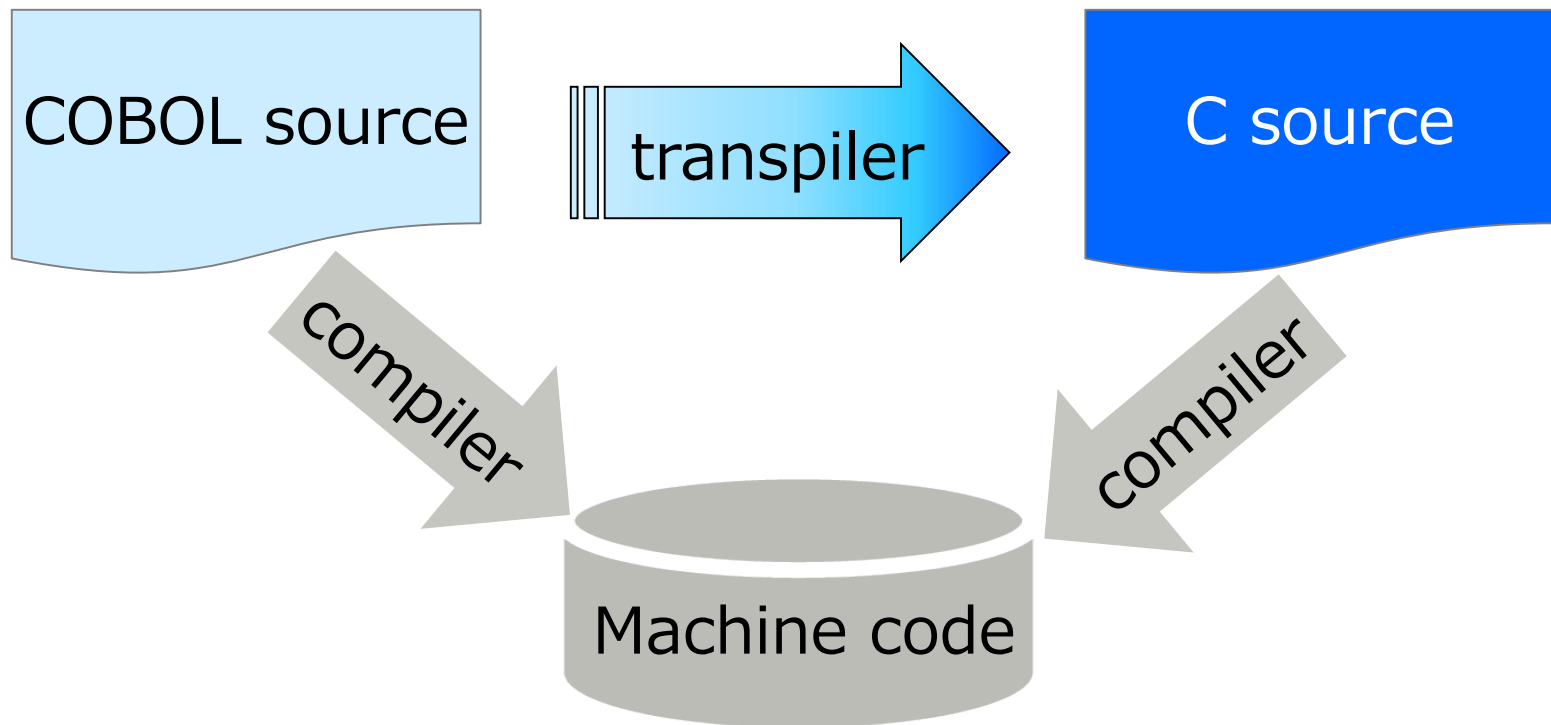

## JSweet

Transpiler from Java to JavaScript  
<http://www.jsweet.org/>

Change source code in a language to same code in a different language

## Difference between transpiler and compiler

# Examples of transpiler

## ◆ Legacy language

- Fortran → C (f2c)
- C++ → C (cfront)

## ◆ JavaScript (altJS)

- TypeScript → JavaScript
- CoffeeScript → JavaScript

## ◆ Legacy to JavaScript

- Java → JavaScript (GWT, JSweet)
- Haskell → JavaScript (GHCJS)

## ◆ pros

- Need not know JavaScript
- Easy to migration of legacy Java app
- IDE support

## ◆ cons

- Rapid frontend technology
- API mismatch

- ◆ Java → TypeScript(JavaScript) transpiler
  - <http://jsweet.org>
- ◆ Syntax Mapper
  - Only Syntax conversion
  - Use JavaScript API in Java code
- ◆ Resolve existing problems of transpiler

## Input Java source

```
Button button = new Button();  
button.setLabel("click me");
```

transpile

Need not modify Java source

## Output JavaScript

```
var button = document.createElement("button");  
button.innerText = "click me";
```

# JSweet transpiler (Syntax Mapper)

Input Java source

```
Button button = new Button();  
button.setLabel("click me");
```

Modify Java  
source

API conversion

Modified Java source

```
HTMLButtonElement button =  
    document.createElement(StringTypes.button);  
button.innerText = "click me";
```

transpile

Syntax Mapper

Output TypeScript

```
let button : HTMLButtonElement=  
    document.createElement("button")  
button.innerText = "click me";
```

Need source modification before transpilation

Resolve by  
Candy

No modification

Application

Modified code

Common Library(Candy)

JavaScript API(Candy)

Java  
source

JavaScript impl

separation

Good for systems using common  
library/framework

# JSweet (practical way)

## Input Java source

```
Button button = new Button();  
button.setLabel("click me");
```

```
public class Button extends JButton {  
    public void setLabel(String label) {  
        this.label = label;  
    }  
}
```

No  
modification  
for app

Modify only  
library  
(API conversion)

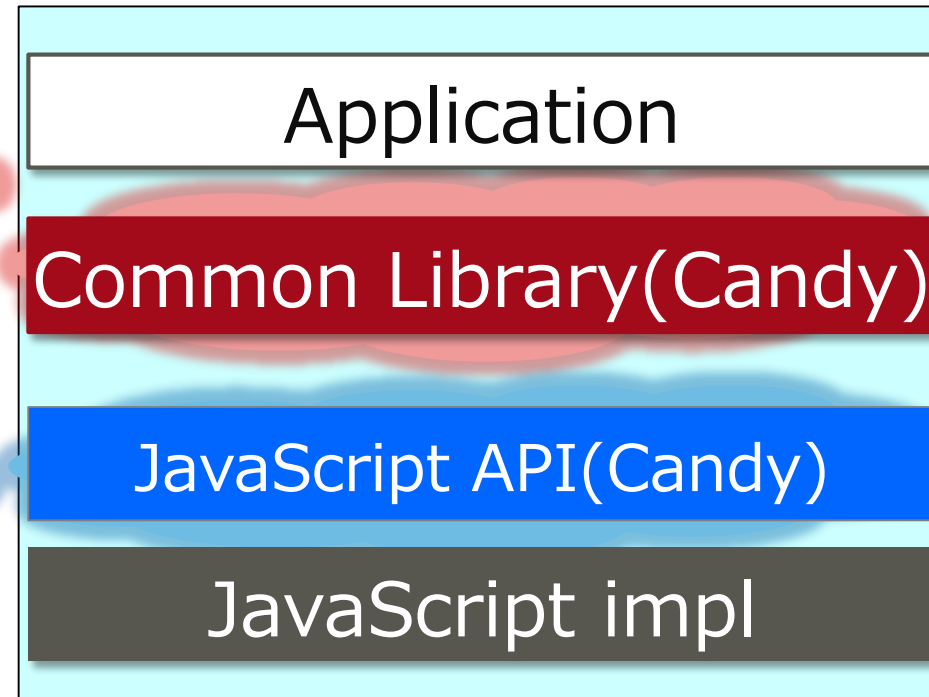

```
Button button = new Button();  
button.setLabel("click me");
```

```
public class Button {  
    public Button {  
        button =  
            document.createElement(StringTypes.button);  
    }  
    public void setLable(String label);  
        button.innerText = label;  
    }  
}
```

transpile

Syntax Mapper

- ◆ Bridge between Java and JavaScript
  - There are 1744 Candy registered (as of 2018/5)  
<http://www.jsweet.org/candies-releases/>
  - Can create your own
- ◆ Candy types
  - Java Candy:  
common Java library can be used by JSweet
  - JavaScript Candy:  
bridge to existing JavaScript

## Summary of system

- ◆ 22K LoC Applet
- ◆ Created more than 10years ago
- ◆ Use Fujitsu GUI product

## Requirements

- ◆ Migrate to JavaScript with less cost and time
- ◆ Must be same as before for Looks and operation
