JSR-234 Advanced Multimedia Supplements - Change Log

#	Change Description	Reason	Spec version
1	Allowed/disallowed Player states when adding Players to Modules JSR 234 defines: "Adding or removing `Player`s or MIDI channels is not possible if any of the `Player`s is in PREFETCHED or STARTED state." This definition is incomplete. The text should read: "Adding or removing `Player`s or MIDI channels is not possible if any of the `Player`s in the `Module` or the one being added is in UNREALIZED, PREFETCHED or STARTED state." The same change applies to several methods in the Module interface and the method descriptions need to be updated accordingly.	One of the disallowed Plaer states has not been mentioned in the specification. The change will correct this specification bug.	1.1
2	Clarifications to permission class: javax.microedition.amms.AmmsPermission Inheritance path for the permission will be defined (inherits from BasicPermission). Table 4 will be corrected to talk about "target" instead of "action". Specification for the class including the class constructor will be added.	Specification for the permission class is incomplete. It is not clear which class it should be inherited from and it is not clear what the constructor should be like.	1.1
